Crystal report viewer logon failed error

Community Advice: ASP | Select SQL for © this FUNCTION ASPAlliance.com XML | Email List | Link to Us | After entering the correct password, you can enter the correct password. Logon failed because you cannot log on to the database. When continuing without preview Electronic files are not created. Solution: 1. To the ODBC Client Driver tab, at least one of the original SQL Server client ODBC drivers should appear in the list. Install Microsoft SQL Server Legacy Client Settings: Example: Microsoft SQL Server 2012 Setup screen if you are using a dataset ADO.NET as your data source Selecting the Database option > Check from the context menu of the report designer often resolves this issue. Additionally, you will receive this error if your report contains a linked table, and you fail to set up a data source for a particular table. Editing is to remove a table from a report or set it as a data source correctly. For example, if your report contains the Customer table and the Associated Purchase Order table on some keys, you must set up a data source for both tables. If you forget and set only one, you will get an error. Database logon failed, which is quite misleading. Generate new customer order report CustomerOrdersReport = New CustomerOrdersReport(); Get report information DataTable = getCustomersData(); Database.Table [orders] SetDataSource(Purchase Order Table); Don't forget this line like I do!! February 11, 2014, 8:41 PM #1 Hi. I developed the application and now when I work on another computer except the developed computer, so all the insertion is good, but when it comes to crystal reports, so the logon error fails. This is my code that produced the crystal report: above this code has the insert command, then code: try if chkReport.Checked = actually pulloneRecord (SaleMaster, SaleID=&txtSaleID.Text) dim objCr is crSale objCr.SetDataSource(dsSql.Table(SaleMaster) frmSaleReport.crvSale.ReportSource=objCr frmSReport.Show.Show) End If I run the same settings on the developed machine to run it. But not on other computers. Please advise me for this. February 12, 2014, 2:00 PM #2 You must provide the connection information in the code using the JG ConnectionInfo property ... to mark your thread as resolved using the Thread Tools menu. February 12, 2014, 08:46 PM #3 February 12, 2014, 09:34 PM #4 I mean sending the connection data to crystal report to Lao RPT JG... if your problem is resolved, remember to mark your thread as corrected using the thread tool menu 13 Feb 2014 05:42 #5ปัญหาลงมือได้บริการแก้ไขแล้ว. I recently selected the verified databaase option in the Crystal report and I replaced the server name as (local). Actually, it's creating problems. When I did it, I created the settings and installed them on another PC and it worked flawlessly. Thank you very much Jggzt for your time and loyalty CodeProject, 20 Bay Street, 11th Floor, Toronto, Ontario, Canada M5J 2N8 +1 (416) 849-8900. Database logon failed at least once. When confronted with it, this error is self-explanatory. Our report cannot log on to the database. It can also manifest itself with text. The connection could not be opened. There are times when all clear checks, such as making sure that the specified username and password are not correct, do not work. What is the next step? In this article, we will explore other things you can do to get this error. If your report uses one or more ODBC DSN (data source names) that is more important, make sure that the DSN is created in the correct ODBC DSN area that matches the bits of third-party tools (such as 32 vs. 64-bit) in Windows.exe. For 64-bit DSNs and c:\windows\system32\syswow64\odbcad32.exe for 32-bit versions), or use Windows Search and ODBC Search, and then select ODBC Data Source (32-bit) in one version. The unc path matters file-based databases on mapped drives are great for convenience, but unfortunately they disappear as soon as the user logs off. Most tools that run as a service and require database access will fail because the mapped path specified in your report is incorrect as soon as the user logs off. It's best to always specify any path in full UNC format. Instead of p:\my report, i should read \\myserver\reports\reports\ To make sure that this path is correct. One of the best features of the subreport is the fact that they can be connected to a completely different data set, even if the data is in a completely different database. For third-party tools It is important if your subreport uses a separate data source. Main Report You must specify credentials for that data source. Table-level logging, another really useful feature in crystal reports, is that the main report can use related tables that are in different databases or even servers. For example, the Customers table can be in SERVERX, and you can connect to the Orders table in SERVERY. If this is setting up your report again, you can set up your report again. All the functions mentioned above and more are available today in remiCrystal and you can download a 14-day free trial from here Winardi December 9, 2020, uncategorized crystal report login failed. - We have a client server based on Visual Basic program, this program is running on Windows 7 Professional and connects to SQL Server, the program works fine, but when we reinstall it on another machine there is an error message. Logon failed. On the Crystal Report Viewer window, when a user tries to print a report, the report is displayed. We have verified the security credentials on the SQL server, checked the ODBC settings on the control panel, tried to add the user as a local administrator on the client computer, etc. but it did not work. Later, I found a group on a SQL server called SQLServerMSSQLUser \$ranap2 \$MSSQLSERVER (ranap2 is the server name) by adding the domain user account to the local group that solved the problem. Step-by-step instructions to resolve the sql server failover crystal server logon report where your database is located:1 Click Start > Control Panel > More Tools > Computer Management > Users and Groups > Groups2. Double-click SQLServerMSSQLUser\$. Add a user who has a logon error fails in the Crystal Exit report as the server information that MS SQL Server installs: Windows OS 2003 Server R2 64 Bits 32GB RAM SQL Server Management Studio 10.0.4067.0Microsoft Analysis Services Client 10.0.4067.0Microsoft Data Access Components (MDAC) 3.86.3959 Microsoft MSXML 2.6 3.0 6.0Microsoft Internet Explorer 8.0.6001.18702Microsoft .NET Framework 2.0.50727.3655 System 5.2.3790 Read SCNotification Has Stopped Error
